

GFZ ISDC portal

—

Unique door to data and information

B. Ritschel (1), *ISDC Team* (1,2,3,4)
rit@gfz-potsdam.de, isdc-l@gfz-potsdam.de

- (1) GFZ Potsdam, Data Center, Germany (*Ph. Burges, R. Kopischke, St. Loos, H. Palm*)
- (2) Universität Potsdam (*S. Freiberg*)
- (3) Hasso Plattner Institut Potsdam (*L. Gericke*)
- (4) Hochschule Neubrandenburg (*O. Volgmann, St. Lowisch*)

Outline

- Business case – Management of scientific data
- Features and architecture of the ISDC portal
- ISDC portal user and archive statistics
- Presentation of the new portal
(<http://isdc.gfz-potsdam.de>)
- ISDC product philosophy
- Definition of ISDC products
- ISDC product metadata (DIF standard)
- The future of the ISDC portal

Business Case

Complete management of products (data + metadata)

by providing different services for

- **data providers** (scientists and engineers)
- **data users** (scientists, pupils and students, decision makers, other interested parties, ...)
- **project management** (scientific and administrative staff)

for grand geoscientific projects and missions

=> **Information System and Data Center**
(ISDC portal, <http://isdc.gfz-potsdam.de>)

Welcome to the Information System and Data Center for geoscientific data

ISDC's online service portal is an access point for all manner of geoscientific geodata, its corresponding metadata, scientific documentation and software tools. The majority of the data and information, the portal currently offers to the public, are global geomonitoring products such as satellite orbit and Earth gravity field data as well as geomagnetic and atmospheric data for the exploration. These products for Earths changing system are provided via state-of-the art retrieval techniques. The ISDC portal's design and the operation is a project of the ISDC-team within the GFZ's Data Center. We invite you to use our services and they will benefit your scientific work. If you have any queries while using the site, please use the -Symbol to get context-sensitive help. Try it now .

[New Features and Documents](#) |

The **Product Type** description section is now available. New documents describing the ISDC are accessible in the "Document" section.

ISDC Collaboration Projects

The GFZ CHAMP (CHALLENGING Mini-satellite Payload) low earth orbit satellite, mainly designed and operated by different German companies and institutions has been launched in July 2000. CHAMP is providing for the first time simultaneously highly precise gravity and magnetic field measurements over a 8 years period. This allows the tracing of spatial and time variations of both fields for a long time. The provision of regularly radio occultation measurements of the atmosphere and ionosphere are used in a pre-operational phase for weather prediction and space weather monitoring purposes.

[CHAMP ISDC](#) | [MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#)

The twin GRACE (Gravity Recover And Climate Experiment) low earth orbit satellites have been launched in March, 2002. The main scientific objective of this joint NASA, DLR partnership project is the regularly outreach of accurate global high-resolution Earth's gravity field models for the study of gravity time variations caused by deep ocean currents, ocean bottom pressure changes, sea level rise, sea and ice mass variations, soil moisture changes, groundwater transport, and land density. Another scientific objective is the regularly provision of atmosphere and ionosphere profiles measured using radio occultation techniques.

[GRACE ISDC](#) | [MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#) | [Newsletter](#) | [Software](#)

The GGP Project (Global Geodynamic Project) is a long term initiative in order to establish a world wide network of super conducting gravimeter (SG) stations by the voluntary consolidation of unique observatories using such devices. The first phase of the project ran from July 1997 to July 2003. The second phase continuing this project will last until 2007. The high accuracy gravity data are used for study of global motions of the entire Earth as well as for the estimation of local gravity effects caused by atmospheric pressure and groundwater. By the start of high accurate satellite gravity missions CHAMP and GRACE, the SG data got a new impact for the validation and calibration of these missions.

[GGP ISDC](#) | [MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#) | [Newsletter](#) | [Software](#)

The main function of the GGSP (Galileo Geodetic Service Provider) is to provide a terrestrial reference frame, in the broadest sense of the word, to both the Galileo Core System (GCS) as well as to the Galileo User Segment (all Galileo users). This implies that the GGSP should enable all users of the Galileo System, including the most demanding ones, to access and realise the GTRF with the precision required for their specific application. Furthermore, the GGSP must ensure the proper interfaces to all users of the GTRF, especially the geodetic and scientific user groups. In addition the GGSP must ensure the adherence to the defined standards of all its products. Last but not least the GGSP will play a key role to create awareness of the GTRF and educate users in the usage and realisation of the GTRF.

[GGSP ISDC](#) | [MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#)

GGOS is the Global Geodetic Observing System of the International Association of Geodesy (IAG). It provides observations of the three fundamental geodetic observables and their variations, that is, the Earth's shape, the Earth's gravity field and the Earth's rotational motion. GGOS integrates different geodetic techniques, different models, different approaches in order to ensure a long-term, precise monitoring of the geodetic observables in agreement with the Integrated Global Observing Strategy (IGOS). GGOS provides the observational basis to maintain a stable, accurate and global reference frame and in this function is crucial for all Earth observation and many practical applications.

GRACE Project

The GRACE satellites, launched March 17, 2002, are designed to produce new models of the Earth's gravity field with unprecedented accuracy. The estimates of the time variations in the gravity field obtained from GRACE, in conjunction with other satellite and in-situ data, and geophysical models, can provide improved measurements of deep ocean currents, ocean bottom pressure, sea level rise, sea ice mass variation and distribution, soil moisture, groundwater transport, and land density.

[GRACE Project GFZ Homepage](#)
[GRACE Project UTCSR Homepage](#)
[GRACE Project JPL Homepage](#)

[PO.DAAC Archive](#)

GRACE is a joint partnership between the National Aeronautics and Space Administration (NASA) in the United States and Deutsches Zentrum fuer Luft und Raumfahrt (DLR) in Germany. Prof. Byron Tapley of The University of Texas Center for Space Research (UTCSR) is the Principal Investigator (PI), and Prof. Christoph Reigber of the GeoForschungsZentrum (GFZ) Potsdam is the Co-Principal Investigator (Co-PI).

The GRACE scientific products are divided in two categories:

- [Orbit & Gravity Field Products](#)
- [Atmosphere & Ionosphere Products](#).

The Galileo Geodetic Service Provider Prototype

The establishment of the Galileo Reference Service Provider (GRSP) is a project funded within the sixth framework programme of the European Union. Call number 2420 of the second call for proposals asked for the "Implementation of Galileo Geodetic Service Provider Prototype".

[GGSP Project Homepage](#)

The target of the Galileo Geodetic Service Provider (GGSP) is the development of the Galileo Terrestrial Reference Frame (GTRF) and the establishment of a service with data, products and information for the potential Galileo users. The project started in July 2005 and will finish probably at the end of 2008.

This [portal](#) is to inform the public about the progress of the project. In a later stage it will offer a variety of information in different specifications.

IAG's Global Geodetic Observing System

GGOS is the Global Geodetic Observing System of the International Association of Geodesy (IAG). It provides observations of the three fundamental geodetic observables and their variations, that is, the Earth's shape, the Earth's gravity field and the Earth's rotational motion.

GGOS integrates different geodetic techniques, different models, different approaches in order to ensure a long-term, precise monitoring of the geodetic observables in agreement with the Integrated Global Observing Strategy (IGOS). GGOS provides the observational basis to maintain a stable, accurate and global reference frame and in this function is crucial for all Earth observation and many practical applications.

GGOS contributes to the emerging Global Earth Observing System of Systems (GEOSS) not only with the accurate reference frame required for many components of GEOSS but also with observations related to the global hydrological cycle, the dynamics of atmosphere and oceans, and natural hazards and disasters. GGOS acts as the interface between the geodetic services and external users such as GEOSS, IGOS-P, and United Nations authorities. A major goal is to ensure the interoperability of the services and GEOSS.

With this the geodetic community can provide the global geosciences community with a powerful tool consisting mainly of high quality services, standards and references, and of theoretical and observational innovations.

© GGOS (Pages still under Development, welcome to comments, text and picture content, which should be sent to weisse@gfz-potsdam.de or post comments into the Open Forum). Last update: 14:53 26/10 2005

ICGEM

[MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#) | [Documents](#)

ICGEM Project

The ICGEM at the GFZ Potsdam is one of six centres of the International Gravity Field Service (IGFS) of the [International Association of Geodesy](#) (IAG). The ISDC is starting a cooperation with the ICGEM in order to improve the quality of data and services by collecting and associating specific metadata to the gravity field models. Another objective of the cooperation is the integration of this gravity field products into the ISDC catalog system and archives. Both web sites, the ICGEM offering excellent gravity model visualisation services as well the planned ICGEM ISDC will exist in parallel.

[ICGEM Project Homepage](#)

In the current ICGEM ISDC project phase all available and appropriate metadata to the gravity model data are collected and checked. Within the second phase standardised gravity model data metadata documents in the DIF format will be prepared. After a careful metadata review process, the "new" gravity model products (now consisting of data and metadata) will be transferred to the ICGEM ISDC. In the last phase the ISDC catalog will be updated and the new products will be stored in the ISDC archives. From this moment the users can search and access the data using the ICGEM ISDC catalog retrieval and data delivery services.

[MyRetrieval](#) | [Product Browser](#) | [Product Description](#) | [Document List](#) | [Documents](#)

TerraSAR-X TOR Project

TerraSAR-X (TSX), the first German long-duration radar mission, is being realized in the frame of a public-private partnership between the German Aerospace Center (DLR) and Astrium GmbH. The spacecraft will carry as primary instrument an X-band imaging system and a high-performance antenna system, enabling different operational modes. The spacecraft will be injected into a sun-synchronous, circular dusk-dawn orbit at approximately 514 km altitude. The launch is foreseen for the end of October 2006 from the cosmodrome Baikonur. The mission is designed for a five year lifetime.

[TerraSAR-X Project Homepage](#)

The satellite payload will generate and down-link X-band SAR raw data, which will be processed on ground to generate X-band SAR basic products. Both partners will use SAR data and basic products for their respective fields of interest, DLR for standard science applications, Astrium for the commercial market. TSX SAR data for the science community will be made available by the DLR CAF in Oberpfaffenhofen. GFZ Potsdam and the CSR in Austin are collaborating in providing a precise dual frequency GPS flight receiver to the mission to enhance the quality of the scientific SAR products. GFZ Potsdam, the CSR in Austin and the Technical University Berlin are in particular interested and will collaborate in the precision processing of TerraSAR-X SAR data for environmental, geophysical and hydrological investigations.

ISDC portal – Data Delivery Monitor

[General Documents](#) | [Pictures](#)

Science for Kids - Kids for Science

The necessity to encourage children and students to deal with modern science and technology as well as the general liability for scientists and engineers to invest in public outreach and education compose the ideas of a 2-years cooperation project -Science for Kids- between the Data Center of the GFZ Potsdam and a grade of school of the Weinberg-Gymnasium Kleinmachnow. The project objectives are both the transfer of scientific and technical knowledge by colleagues of the Data Center ISDC-Team and teacher of the high school to the students and the creation of -Science for Kid- Web pages by the project participants for children and students. The scientific frame of the project activities are the objectives and results of the satellite projects CHAMP and GRACE and the appropriate Information Systems and Data Center (ISDC) designed and operated by the ISDC Team.

public outreach

...:Das Magnetfeld der Erde::

Zunächst ist es schwierig sich unter dem Magnetfeld der Erde etwas vorzustellen. Wir können es nicht sehen, nicht hören und auch nicht fühlen. Einige Tierarten jedoch nutzen es zur Navigation. Trotzdem wir es nicht merken ist es dennoch vorhanden und hat große Auswirkungen auf unser Leben.

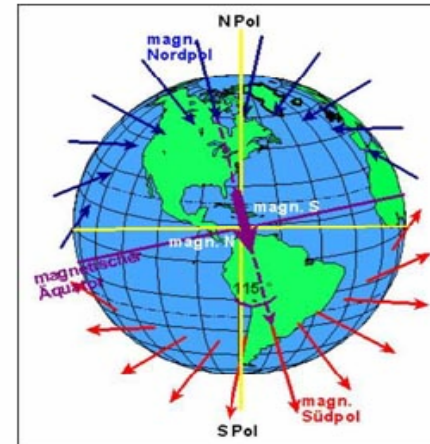

Das Erdmagnetfeld hilft uns die Prozesse im Innern der Erde zu verstehen. Es schützt uns, zum Beispiel vor der Teilchenstrahlung der Sonne (Sonnenwind). Wir können es sowohl an der Erdoberfläche messen, als auch durch Satelliten im Weltraum. Wie das Feld ursprünglich entstand, ist noch nicht klar. Es gibt aber die so genannte Dynamothorie vom Geodynamo, die den Erhalt des Magnetfelds erklärt: Der flüssige Teil des Erdkerns rotiert und dadurch entsteht ein Stromfluss. Dies bezeichnet man als Induktion. Der Strom wird also induziert. Dieser Stromfluss ruft (wie jeder andere Stromfluss auch) seinerseits ein Magnetfeld hervor – das Erdmagnetfeld.

Die Einheit der Feldstärke B ist nT (Nanotesla). Man benutzt sie, weil ein Tesla viel zu groß wäre um ein Magnetfeld zu beschreiben. Das Erdmagnetfeld hat eine Stärke von 30000 bis 60000 nT. Der Dipolmoment beträgt derzeit etwa $8 \cdot 10^{22} \text{Am}^2$.

In erster Näherung ist das Magnetfeld ein Dipolfeld. Beim genaueren Hinsehen unterscheidet es sich aber doch von einem solchen Dipolfeld. Es wurde z. B. durch die Messungen herausgefunden, dass das Feld im Südatlantik eine Anomalie aufweist. Hier ist das Feld viel schwächer als in anderen Bereichen. Dies ist nur eine von sehr vielen „Unebenheiten“ unseres Magnetfeldes.

Das Magnetfeld besteht aber nicht nur aus einem Feld, welches der flüssige Erdkern erzeugt. Dies entspricht nur etwa 95% des gesamten Erdmagnetfeldes. Außerdem gibt es aber noch weitere Schichten die Magnetfelder erzeugen, die kleiner sind und sich dem Hauptfeld überlagern: das Krustenfeld und das Außenfeld.

Ein weiterer Punkt mit dem sich Wissenschaftler auseinandersetzen ist die bevorstehende Umpolung des Magnetfelds. Unsere Nachforschungen ergaben, dass niemand weiß, wann der Zeitpunkt dieser Umpolung ist. Es gibt aber verschiedene Theorien.

ISDC Product Philosophy and Metadata Processing

ISDC Product = Data File + Metadata File (extended DIF-Standard)

ISDC Metadata Standard = Parent DIF (V. 9.0) + Extended Child DIF(s)*

<http://gcmd.nasa.gov/User/difguide/difman.html>

*in preparation

Metadata for Global Earth Gravity Field Models (GEGFM)

List of possibly metadata attributes for GEGFM

- Entry_Id, Entry_Title (unique identifier and title)
- Personnel (Author of Model, Author of DIF)
- Science Keywords (Earth Gravity Field,)
- Temporal Coverage
- Spatial Coverage (global, regional, local)
- Temporal and Spatial Resolution (1 year, 1 month, ... 1 °, ?)
- Data Source (satellite tracking data, gravity data, altimetry data)
- Quality (description)
- Reference (list of publications)
- Data Centers (IGFS, ICGEM, ISDC)
- Representation (Spherical Harmonic Coefficients, Maximum Degree of the Expansion)
- Grid (Geoid, Gravity Anomalies, Gravity Disturbances)
- Calculation Method, Software Package
- DOI (Digital Object Identifier)
- ...

Parent DIF V. 9.0

Child DIF (extended)

Metadata Example for GEGFM - unique models

The future of the ISDC portal

- **Thematic product access** using metadata ontologies (semantic web) derived from product type dependent parent and child DIF V. 9.0 metadata documents
- **Implementation of standardized ISO/OGC web services** (using DEGREE) for networking information systems, catalogue services and open access libraries (Open Access Initiative)
- **Development of new ISDC applications** (e.g. visualization, publication of data using DOI [unique identifier], ...)
- **Integration of new collaboration projects** (e.g. ICGEM, TSX TOR, Galileo, GEOFON) and new products and services

=> **To play an active role in the IAG GGOS project**

- **Integration of the ISDC system** into the new GFZ web portal frame work and WDC Terra

IAG's Global Geodetic Observing System (GGOS)

GGOS
<http://www.ggos.org>

IAG services are based on more than 400 global observation stations.

The Vision of GGOS*

- GGOS integrates different geodetic techniques, different models, different approaches in order to achieve better long-term consistency, reliability and understanding of geodetic, geodynamic and global change processes.
- GGOS provides the scientific and infrastructure basis for all global change research in Earth sciences.

*H. Drewes, Ch. Reigber

GGOS

GGOS – Virtual Geodetic Observatory

- > 1000 different geodetic product types (covering all geodetic techniques and level of processing)
- > 100,000,000 data sets, > 100 TB of data (all over the world distributed)
- > 10.000 international users and user groups

GGOS – Virtual Geodetic Observatory

- **Creating a standardized metadata catalog (e.g. DIF-based) for describing and identifying**
 - Products (time series ... global models)
 - Scientific (Web) services (IGS, ILRS, IERS, ...)
 - Projects, platforms, instruments, techniques, processing S/W, persons, data center, ...
 - Main fields of data usage by scientific keywords describing the content and use of data
 - References like related literature, applications, software, ...
 - Different interfaces for data access

GGOS – Virtual Geodetic Observatory

- Offering (harmonized) ontology-based multi-domain metadata catalog
 - for thematic search and
 - for OGC/ISO/... compliant Web services
- Providing access links (using persistent identifiers)
 - to validated and
 - tailored productsin (near)realtime for
 - all kind of usage and
 - all kind of users

International
Association of Geodesy

Thank you very much
for your attention!
